

**Your child isn't
bad at maths.
They're two
topics behind.**

It's almost always the same two

Fractions in Year 7. Negative numbers in Year 8. Across the Cambridge and IGCSE students our mentors work with, the ones who say they aren't a maths person have nearly always lost one or both.

Everything after that looks like weakness

Once fractions are shaky, ratio breaks. Then algebra. Then trigonometry. By Year 10 it reads as ability. It is arithmetic nobody was given time to finish.

Marks hide the cause

A report says 42 percent. It does not say which four topics produced it. That is why work harder rarely moves the number - the effort goes to the wrong place.

Find the line, not the grade

Our mentors work backwards through the curriculum until the answers stop being wrong. That point is the real starting line, and it is usually three or four topics earlier than parents expect.

Two topics is a term, not a year

Closing a genuine gap takes weeks, not a rebuild. The reason it feels impossible is that nobody has named which two.

**Send this to a parent
who has been told
their child isn't a
maths person.**
